(1)

(a) To determine whether the series converges for  $z$ , we can use the ratio test.

The ratio of consecutive terms is given by

Taking the limit as  $n$  approaches infinity, we have

Since the limit is less than 1, the series converges for  $|z| < 1$ .

(b) To determine whether the series converges for  $z$ , we can again use the ratio test.

The ratio of consecutive terms is given by

Since the ratio is a constant value less than 1, the series converges for  $|z| < 1$ .

(2)

Since  $\sum_{n=0}^{\infty} z^n$  is convergent for  $|z| < 1$ , it converges within a certain radius of convergence. Let's call this radius  $R$ .

For  $z = 1$ , we can calculate the distance from  $z = 0$  using the distance formula:

Since  $|z| < 1$ , the series  $\sum_{n=0}^{\infty} z^n$  is absolutely convergent.

(3)

(a)

To compute  $\cos(z)$ , we can use the formula  $\cos(z) = \frac{e^{iz} + e^{-iz}}{2}$ .

To compute  $\sin(z)$ , we can use  $\sin(z) = \frac{e^{iz} - e^{-iz}}{2i}$ , where  $\theta$  is the principal value of the argument of  $z$ .

To compute  $\cos(z)$ , where  $z = x + iy$ ,

(b)

To compute  $\sin(z)$ , we can again use the formula  $\sin(z) = \frac{e^{iz} - e^{-iz}}{2i}$ .

To compute  $\cos(z)$ , we can use  $\cos(z) = \frac{e^{iz} + e^{-iz}}{2}$ , where  $\theta$  is the principal value of the argument of  $z$ .

To compute  $\sin(z)$ , where  $z = x + iy$ ,

(4)

(a)

We can represent  $a_n$  as  $\frac{1}{n!}$ .

Using Euler's formula,  $e^{ix} = \cos x + i \sin x$ , we have

(b)

To show that the series  $\sum_{n=0}^{\infty} \frac{1}{n!}$  is absolutely convergent, we can use the comparison test.

Let's compare the series to the convergent series  $\sum_{n=0}^{\infty} \frac{1}{2^n}$ .

Using the inequality  $\frac{1}{n!} < \frac{1}{2^{n-1}}$  and  $\frac{1}{n!} < \frac{1}{2^n}$ , we have

Since the series  $\sum_{n=0}^{\infty} \frac{1}{2^n}$  converges, and we have a constant upper bound for the absolute value of each term in the series  $\sum_{n=0}^{\infty} \frac{1}{n!}$ , we can conclude that the series  $\sum_{n=0}^{\infty} \frac{1}{n!}$  is absolutely convergent.

(c)

To determine whether the series  $\sum_{n=0}^{\infty} \frac{1}{n!}$  is convergent or divergent for  $x$ , where  $x > 0$ , we can use the comparison test again.

Using the same inequality as in part (b), we have

Since  $\sum_{n=0}^{\infty} \frac{1}{2^n}$  converges,

Therefore, by the comparison test, we can conclude that the series  $\sum_{n=0}^{\infty} \frac{1}{n!}$  is convergent for  $x > 0$ , where  $x > 0$ .

(5)

(a)

To determine the radius of convergence of the power series  $\sum_{n=0}^{\infty} \frac{1}{n!} x^n$ , we can use the ratio test.

The ratio of consecutive terms is given by

Taking the limit as  $n$  approaches infinity, we have

where  $|x|$  is the modulus of  $x$ .

Therefore, the radius of convergence of the power series is  $\infty$ .

(b)

For  $x$  in the disk of convergence, the sum of the series  $\sum_{n=0}^{\infty} \frac{1}{n!} x^n$  is given by

Since the Fibonacci sequence has the general term  $F_n = \frac{1}{\sqrt{5}} \left( \frac{1+\sqrt{5}}{2}^n - \frac{1-\sqrt{5}}{2}^n \right)$ , we can substitute this expression into the series.

Using the formula for the sum of a geometric series, we can simplify this expression as

Therefore, the sum of the series is  $\frac{1}{\sqrt{5}} \left( \frac{1+\sqrt{5}}{2} - \frac{1-\sqrt{5}}{2} \right) = 1$ .
